FURNACES PURCHASED
AS FAR BACK AS 1972,
STILL IN USE TODAY!**

**Building a Superior
Hot Water
Wood Furnace
for 35 Years!**

WE BUILD IT STRONG WE BUILD IT SIMPLE

The firebox is .380" thick as compared with others that are as little as .125", thin, weak and flimsy.

We have NEVER had one split, rust or burn through!

The SHAVER weighs 1600 lbs which is a testament to the massive amount of metal we put into each furnace.

We believe that a furnace doesn't have to be complicated and have every new electronic gizmo on it. Electronics *always* fail, sooner or later.

Simple is always BEST. Our customers love the simplicity of our furnaces and we are sure you will to.

Inside View

The forced air blower is mounted at the rear of the furnace; safer than on the door. The air is blown up through the grate providing air directly under the wood (like a blacksmith) for quick and even heat on demand.

Firebox size is 36" wide x 26" high x 34" deep. So there's lots of room for large pieces of firewood!

HEAT YOUR HOME, GARAGE, POOL AND HOT WATER

The standard Shaver Furnace comes with one pump and TRIPLE Hookup. Two for heat and one for hot water. The 50 foot 5/8" Copper, Potable Water Coil can be hooked up directly to your hot water heater. No separate heat exchanger is needed!

This saves you \$30- \$60 a month!

Why buy a Shaver Furnace

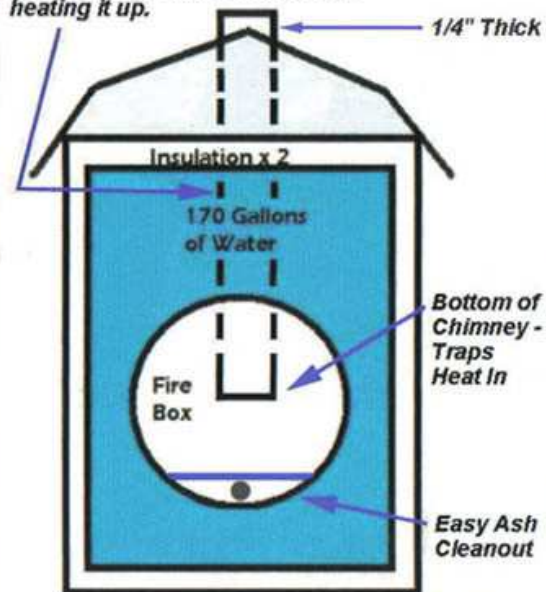

- * With fast rising fuel prices, wood is still the cheapest fuel to burn.
- * Place the furnace where it's convenient for you to load your wood/coal.
- * It's outside so there are no bugs or ashes to deal with. No smoke either!
- * An outdoor furnace means less loading - as little as once a day.
- * Water heat does not dry up your sinuses like a gas/wood flame does.
- * It eliminates respiratory problems caused by burning wood indoors.
- * Wood is cheaper and less work. Instead of splitting 12" - 18" pieces of wood, you can put 30" long full rounds in this one. That makes buying wood even cheaper.
- * It's much SAFER than a fireplace!
- * Get lower insurance rates!
- * Designed to work with any existing heating system, be it forced air, radiant, hydronic or a boiler - or even *no* system. Works excellent with radiant heat under floors, radiators, in concrete & for melting driveways!

NO WASTED HEAT!

The firebox is *TOTALLY* surrounded with water, as is the flue, the ash pan and the front and back of the furnace. This way you capture all of the heat. No heat escapes to the outside without passing through water first.

The chimney traps heat in the firebox, coming halfway to the firebox floor, so heat doesn't rush out of the chimney. You get the maximum amount of heat transfer to the water from your fire. This also allows for the gases to burn off before escaping up the flue.

Flue goes through water, further heating it up.

WATER CAPACITY- Shaver 165 has a Huge 170 Gallon tank unlike others with 90 gallon tanks!

The Water Tank is made of 1/8" thick metal (11 Gauge) - 2 times thicker than many others using only 16 gauge. The tank houses a domestic hot water coil, as well.
